HYDAC INTERNATIONAL

Filter Elements Betamicron®4. For Reduced Life Cycle Cost.

Good. Be<mark>tter.</mark> Be<u>tamicron[®]4</u>

The previous Betamicron®3 technology already provided certainty: A high level of fluid cleanliness with long-term stability for hydraulic and lubrications systems. The new generation Betamicron®4 goes one better: Outstanding performance data for reduced Life Cycle Cost.

The key innovations of the 4th Generation are:

Optimized mesh pack structure with newly developed filter media and additional drainage layer.

Improved performance data (particle separation, contamination retention, $\Delta p/Q$ characteristics).

Patented process for longitudinal seam bonding.

Element is fully discharge-capable.

Use of spiral lock seam support tubes Element outer wrap in plastic (previously metal)

Technical data:

Pressure stability: Low pressure differential stability: 20 bar (BN4HC); High pressure differential stability: 210 bar (BH4HC) Filtration ratings: 3, 5, 10, 20 µm

Reduced shipping and waste disposal cost

(HYDAC)

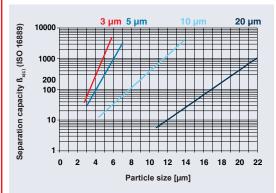

Betamicron®4. High-

Optimized three-layer filter mesh pack structure with new glass fibers

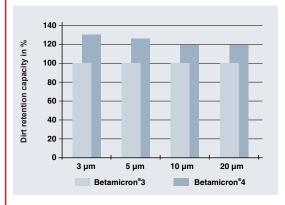

Absolutely new filter media were developed for the new Betamicron®4 filter elements. Due to the 3-stage structure, highest contamination retention and separation capacity are ensured. As a result of the integration of an additional drainage layer, the fluid flow is directed in an optimum way, and particularly favorable $\Delta p/Q$ characteristics are achieved.

Longer element service life and energy cost savings due to particularly low pressure losses across the element

Better component protection and longer system service life due to improved separation capacity (with filter ratings 3 and 5 μ m)

Longer element service life and lower operating costs due to increase in the contamination retention capacity by up to 30 %

Patented longitudinal seam bonding method

An innovative bonding process used for the longitudinal seam ensures completely sealed integration of the cut ends of the mesh pack. Transition of particles from the contaminated to the clean side is eliminated.

High operational reliability, even under dynamic loads, due to tight longitudinal seam bonding.

Zinc-free structure

To prevent the formation of zinc soap, which occurs mainly when watercontaining fluids (HFA/HFC) and bio-oils are used, no zinc-containing components are employed.

- High operational reliability, because elements cannot be blocked as a result of the formation of zinc soap
- Savings in storage costs, because the filter elements can be used universally

Use of spiral lock seam support tubes

The metal tube provided inside the element for stabilization purposes is designed as spiral lock seam tube, which offers unchanged stability while significantly reducing the element weight.

Reduced shipping and waste disposal costs due to weight reduction by up to 30 %

Class Filter Element Technology.

Filter mesh pack protected by outersleeve

The star-pleated filter mesh pack is enclosed in a stable outer plastic sleeve. This sleeve distibutes the incoming fluid evenly over the mesh pack (diffusor effect). In addition the fluid does not flow directly through the mesh pack, and this protects it from pulsating flows. In this way, the element achieves extremely high flow fatigue stength values. Moreover, the mesh pack is protected against mechanical damage, e.g. when elements are being installed. Since the outer sleeve permits overprinting with the customer logo, it can be used as an advertising medium for OEMs, thus ensuring spare parts business. At the same time the user can rely on the fact that he is always buying a genuine spare part.

- High operational reliability, because the sensitive filter mesh pack is protected against direct fluid flows and pulsation
- I Low energy consumption, because due the uniform distribution of the fluid (diffusor effect), a particularly low ∆p is achieved across the element
- Ease of handling, because the compact element is protected against damage in transit and during its installation
- Protection against product piracy through "brand labeling"

The figure shows elements with customer logo, which are increasingly used across all industrial sectors.

Particularly advantageous: The logo is also perfectly legible when the filter is dirty, that is, when the element is actually changed. "Brand labeling" by HYDAC will result in an enormous increase in your spare parts business and improve the process quality through the use of genuine spare parts.

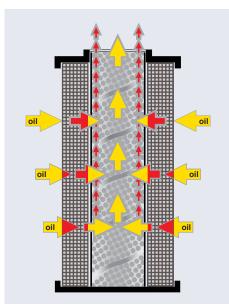

Use of electrically conductive plastics and innovative filter media

Due to a complete revision of the materials used, e.g. conductive plastics, full discharge-capability of the filter elements was achieved.

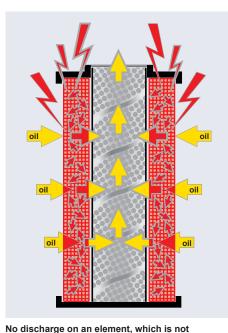

Charging of the filter elements during operation was therefore reduced to an absolutely uncritical level. This means that risks such as sudden sparking and the subsequent formation of black carbon or sludging of the oil are reliably eliminated.

High operational reliability, because the filter element is fully discharge-capable

Betamicron®4 Reduces Life Cycle Cost.

Life Cycle Cost – what does this mean?

The term Life Cycle Cost is today a dominating topic among suppliers, machine builders and end customers. We understand by this the total cost of a system, machine or component from the procurement through to its scrapping.

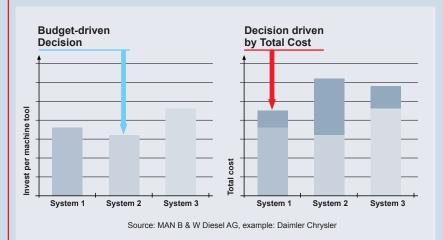

The reduction of Life Cycle Cost is one of the mega trends in mechanical engineering. The objective is to make product costs transparent beyond the purchase price over the entire lifecycle, thus creating a better basis for the customer's buying decision.

Major end customers set this trend.

Leading car makers, for example, require binding information about the Life Cycle Cost and derived variables – e.g. for machine tools for 10 years, for presses even for up to 30 years. Decisions on new investments by machine manufacturers are based on the machine price and the Life Cycle Cost calculation offered.

Cost curve during the total lifecycle of the machine / system

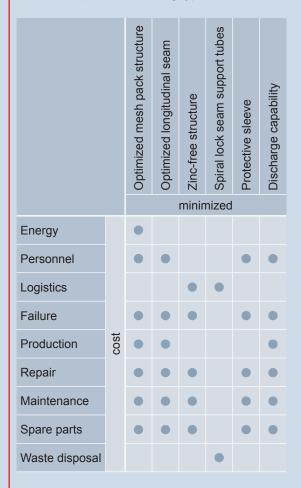

Winner in the system properties

This changed and holistic understanding of cost by end customers naturally results in new challenges that machine manufacturers have to take.

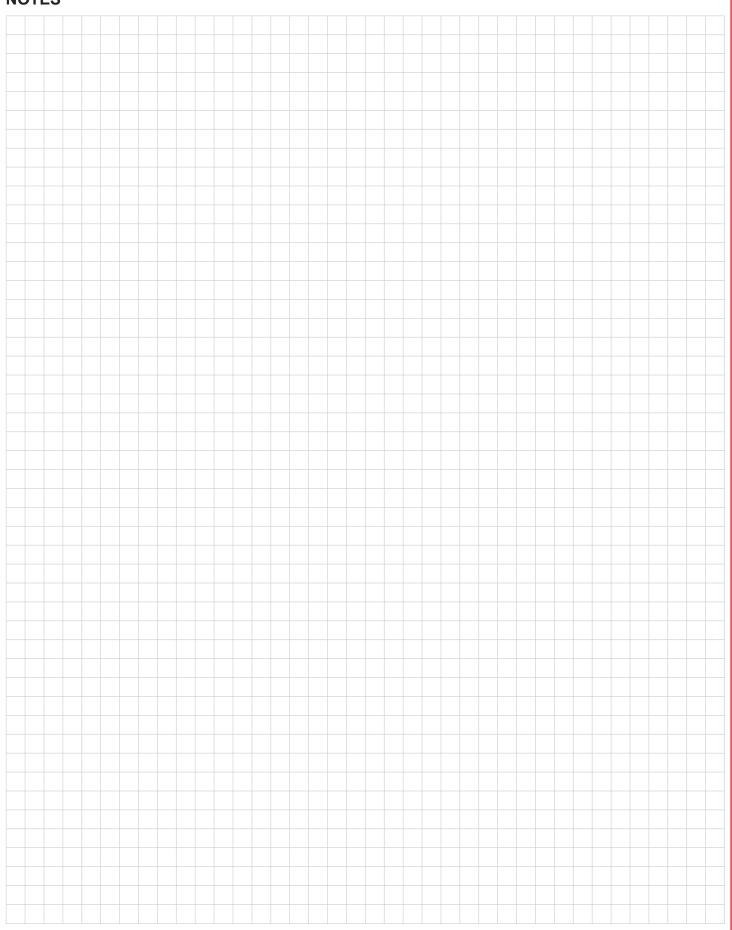

For system concepts, subsystems and components used must also stand the test with regard to their influence on the Life Cycle Cost.

Betamicron[®] 4 elements are the winners in the "Life Cycle Cost contest"

The table summarizes it: Betamicron[®]4 elements result in a minimization of, for example, the following types of cost:

NOTES

NOTE

The information in this brochure relates to the operating conditions and applications described.

For applications or operating conditions not described, please contact the relevant technical department.
